Advanced developer flow

Mendix PhoneGap Build app template

Mendix apps can simply be viewed in mobile web browsers. However, some features of mobile devices cannot be accessed through HTML and Javascript. Also, if you want to publish your app on the Apple App Store, Google Play or Microsoft Phone Store, you have to wrap your app in a native shell. We use PhoneGap to do this. PhoneGap creates a native wrapper around a web application and provides access to native functions through a Javascript API. These apps are also called *hybrid* apps because they are a hybrid of a web and a native app.

This project contains the Mendix PhoneGap Build app template. It can be used to customize your mobile Mendix app, debug the app using emulators, and build installable packages of your app, either locally or using Phonegap Build. By using this template, you can easily adapt many facets of your app, like styling, icons, splash screens, and the login screen.

Prerequisites

- Install NodeJS
 - You can download the installer from <https://nodejs.org/en/download/>
 - On MacOS, you can use Brew to install NodeJS: `brew install node`
 - On Unix, you can use your distro's package manager, e.g. for Debian-based systems: `sudo apt-get install node`
- Make sure that the NodeJS executable is on your path. In most cases, this is done for you by the installer.

Setup

Hint: all text displayed between `like this`, is to be executed from the command line

- Obtain a local copy of this project, by doing one of the following:
 - Download a .zip package through the Mendix Portal. By following this path, a lot of configuration will already be filled in for you.
 - Clone or fork this repository from GitHub
- Install Webpack globally: `npm install -g webpack`
- Install Phonegap globally: `npm install -g phonegap`
- Go to the root directory of the project: `cd <path/to/project`
- Install all dependencies: `npm install`
 - This will also prepare a .zip package that can be sent to Phonegap Build, in the "dist" folder.

Advanced Setup

In order to create deployment packages locally (instead of with Phonegap Build) or to run your app on an emulator, you will need to install additional tooling.

A hand holding a smartphone with a dark overlay and white text. The background is a blurred image of a hand holding a smartphone, with a dark overlay and white text. The text is centered and reads: "Start building your app with the Mobile Quick Starter App".
